What is the Apache ShenYu?

This is an asynchronous, high-performance, cross-language, responsive API gateway.
- Support various languages (http protocol), support Dubbo, Spring Cloud, gRPC, Motan, Sofa, Tars and other protocols.
- Plugin design idea, plugin hot swap, easy to expand.
- Flexible flow filtering to meet various flow control.
- Built-in rich plugin support, authentication, limiting, fuse, firewall, etc.
- Dynamic flow configuration, high performance.
- Support cluster deployment, A/B Test, blue-green release.
2.1 Architecture Diagram
3.1 ShenYu Admin Database Design

Shenyu Admin is the management system of the gateway, which can manage all plugins, selectors and rules visually, set users, roles and resources.

3.1.1 Plugin, Selector And Rule

- **Plugin**: ShenYu uses the plugin design idea to realize the hot plug of the plugin, which is easy to expand. Built-in rich plugins, including RPC proxy, circuit breaker and current limiting, authority and certification, monitoring, and more.

- **Selector**: Each plugin can set multiple selectors to carry out preliminary filtering of traffic.

- **Rule**: Multiple rules can be set per selector for more fine-grained control of flow.

- **The Database Table UML Diagram:**
• Detailed design:
  - One plugin corresponds to multiple selectors, one selector corresponds to multiple rules.
  - One selector corresponds to multiple match conditions, one rule corresponds to multiple match conditions.
  - Each rule handles differently in corresponding plugin according to field handler, field handler is a kind of data of JSON string type. You can view detail during the use of shenyu-admin.

3.1.2 Resource Permission

• The resource are the menus and buttons in the shenyu-admin console.

• Resource Permission use database to store user name, role, resource data and relationship.
• The Resource Permission Table UML Diagram:

• Detailed design:
  – one user corresponds to multiple role, one role corresponds to multiple resources.

3.1.3 Data Permission

• Data Permission use database to store the relationship between users, selectors and rules.
• The Data Permission Table UML Diagram:
  • Detailed design:
    – The most important table is `data_permission`, where a user corresponds to multiple data permissions.
    – The field `data_type` distinguishes between different types of data, which corresponds to the following: 0 -> selector, 1 -> rule.
    – The field `data_id` holds the primary key id of the corresponding type.

3.1.4 Meta Data

• Metadata is used for generic invoke by gateway.
• For each interface method, there is one piece of metadata.
• The Database Table UML Diagram:
  • Detailed design:
    – `path`: When the gateway is requested, a piece of data will be matched according to `path`, and then the subsequent process will be carried out.
    – `rpc_ext`: Used to hold extended information for the RPC proxy.
3.1.5 Dictionary Management

- Dictionary management is used to maintain and manage public data dictionaries.
- The Database Table UML Diagram:

3.2 Data Synchronization Design

This document explains the principle of data synchronization. Data synchronization refers to the strategy used to synchronize data to ShenYu Gateway after shenyu-admin background operation data. ShenYu Gateway currently supports ZooKeeper, WebSocket, HTTP Long Polling, Nacos, Etcld and Consul for data synchronization.

See Data Synchronization Configuration for configuration information about data synchronization.

3.2.1 Preface

Gateway is the entrance of request and it is a very important part in micro service architecture, therefore the importance of gateway high availability is self-evident. When we use gateway, we have to change configuration such as flow rule, route rule for satisfying business requirement. Therefore, the dynamic configuration of the gateway is an important factor to ensure the high availability of the gateway.

In the actual use of Shenyu Gateway, users also feedback some problems:

- ShenYu depends on ZooKeeper, how to use Etcld, Consul, Nacos and other registry center?
- ShenYu depends on Redis and InfluxDB, and do not use limiting plugins or monitoring plugins. Why need these?
- Why not use configuration center for configuration synchronization?
- Why can’t updates be configured dynamically?
- Every time you want to query the database, Redis is a better way.

According to the feedback of users, we have also partially reconstructed ShenYu. The current data synchronization features are as follows:

- All configuration is cached in ShenYu gateway memory, each request uses local cache, which is very fast.
- Users can modify any data in the background of shenyu-admin, and immediately synchronize to the gateway memory.
- Support ShenYu plugin, selector, rule data, metadata, signature data and other data synchronization.
- All plugin selectors and rules are configured dynamically and take effect immediately, no service restart required.
- Data synchronization mode supports Zookeeper, HTTP long polling, WebSocket, Nacos, Etcld and Consul.
3.2.2 Principle Analysis

The following figure shows the process of data synchronization of ShenYu. ShenYu Gateway will synchronize configuration data from configuration service at startup, and support push-pull mode to get configuration change information, and then update local cache. The administrator can change the user permissions, rules, plugins and traffic configuration in the admin system (shenyu-admin), and synchronize the change information to ShenYu Gateway through the push-pull mode. Whether the mode is push or pull depends on the synchronization mode used.

In the original version, the configuration service relied on the Zookeeper implementation to manage the back-end push of changes to the gateway. Now, WebSocket, HTTP long polling, ZooKeeper, Nacos, Etc, and Consul can now be supported by specifying the corresponding synchronization policy by setting `shenyu.sync.${strategy}` in the configuration file. The default WebSocket synchronization policy can be used to achieve second level data synchronization. However, it is important to note that ShenYu Gateway and shenyu-admin must use the same synchronization policy.

As showing picture below, shenyu-admin will issue a configuration change notification through EventPublisher after users change configuration, EventDispatcher will handle this modification and send configuration to corresponding event handler according to configured synchronization strategy.

- If it is a websocket synchronization strategy, it will push modified data to shenyu-web, and corresponding WebsocketCacheHandler handler will handle shenyu-admin data push at the gateway layer
- If it is a zookeeper synchronization strategy, it will push modified data to zookeeper, and the ZookeeperSyncCache will monitor the data changes of zookeeper and process them
- If it is a http synchronization strategy, shenyu-web proactively initiates long polling requests, 90 seconds timeout by default, if there is no modified data in shenyu-admin, http request will be blocked, if there is a data change, it will respond to the changed data information, if there is no data change after 60 seconds, then respond with empty data, gateway continue to make http request after getting response, this kind of request will repeat.

Zookeeper Synchronization

The zookeeper-based synchronization principle is very simple, it mainly depends on zookeeper watch mechanism, shenyu-web will monitor the configured node, when shenyu-admin starts, all the data will be written to zookeeper, it will incrementally update the nodes of zookeeper when data changes, at the same time, shenyu-web will monitor the node for configuration information, and update the local cache once the information changes.

ShenYu writes the configuration information to the zookeeper node, and it is meticulously designed. If you want to learn more about the code implementation, refer to the source code ZookeeperSyncDataService.
Figure 1: Zookeeper Node Design

3.2. Data Synchronization Design
**WebSocket Synchronization**

The mechanism of websocket and zookeeper is similar, when the gateway and the shenyu-admin establish a websocket connection, shenyu-admin will push all data at once, it will automatically push incremental data to shenyu-web through websocket when configured data changes.

When we use websocket synchronization, pay attention to reconnect after disconnection, which also called keep heartbeat. ShenYu uses java-websocket, a third-party library, to connect to websocket. If you want to learn more about the code implementation, refer to the source code WebsocketSyncDataService.

**Http Long Polling**

The mechanism of zookeeper and websocket data synchronization is relatively simple, but http synchronization will be relatively complicated. ShenYu borrows the design ideas of Apollo and Nacos and realizes http long polling data synchronization using their advantages. Note that this is not traditional ajax long polling.

Http long polling mechanism as above, shenyu-web gateway requests shenyu-admin configuration services, timeout is 90 seconds, it means gateway layer request configuration service will wait at most 90 seconds, this is convenient for shenyu-admin configuration service to respond modified data in time, and therefore we realize near real-time push.

After the http request reaches shenyu-admin, it does not respond immediately, but uses the asynchronous mechanism of Servlet3.0 to asynchronously respond to the data. First of all, put long polling request task LongPollingClient into BlockingQueue, and then start scheduling task, execute after 60 seconds, this aims to remove the long polling request from the queue after 60 seconds, even there is no configured data change. Because even if there is no configuration change, gateway also need to know, otherwise it will wait, and there is a 90 seconds timeout when the gateway requests configuration services.

If the administrator changes the configuration data during this period, the long polling requests in the queue will be removed one by one, and respond which group’s data has changed (we distribute plugins, rules, flow configuration, user configuration data into different groups). After gateway receives response, it only knows which Group has changed its configuration, it need to request again to get group configuration data. Someone may ask, why don’t you write out the changed data directly? We also discussed this issue deeply during development, because the http long polling mechanism can only guarantee quasi real-time, if gateway layer does not handle it in time, or administrator updates configuration frequently, we probably missed some configuration change push. For security, we only inform that a certain Group information has changed.

When shenyu-web gateway layer receives the http response information, pull modified information (if exists), and then request shenyu-admin configuration service again, this will repeatedly execute. If you want to learn more about the code implementation, refer to the source code HttpSyncDataService.

3.2. Data Synchronization Design
Nacos Synchronization

The synchronization principle of Nacos is basically similar to that of ZooKeeper, and it mainly depends on the configuration management of Nacos. The path of each configuration node is similar to that of ZooKeeper.

ShenYu gateway will monitor the configured node. At startup, if there is no configuration node in Nacos, it will write the synchronous full amount of data into Nacos. When the sequential data send changes, it will update the configuration node in Nacos in full amount. The local cache is updated.

If you want to learn more about the code implementation, please refer to the source code NacosSyncDataService and the official documentation for Nacos.

Etcd Synchronization

Etcd data synchronization principle is similar to Zookeeper, mainly relying on Etcd’s watch mechanism, and each configuration node path is the same as that of Zookeeper.

The native API for Etcd is a bit more complicated to use, so it’s somewhat encapsulated.

ShenYu gateway will listen to the configured node. When startup, if there is no configuration node in Etcd, it will write the synchronous full amount of data into Etcd. When the sequential data send changes, it will update the configuration node in Etcd incrementally.

If you want to learn more about the code implementation, refer to the source EtcdSyncDataService.

Consul Synchronization

Consul data synchronization principle is that the gateway regularly polls Consul’s configuration center to get the configuration version number for local comparison.

ShenYu gateway will poll the configured nodes regularly, and the default interval is 1s. When startup, if there is no configuration node in Consul, write the synchronous full amount of data into Consul, then incrementally update the configuration node in Consul when the subsequent data is sent to change. At the same time, Shenyu Gateway will regularly polls the node of configuration information and pull the configuration version number for comparison with the local one. The local cache is updated when the version number is changed.

If you want to learn more about the code implementation, refer to the source ConsulSyncDataService.
3.3 Application Client Access

Application client access means to access your micro service to Shenyu Gateway, currently supports HTTP, Dubbo, Spring Cloud, gRPC, Motan, Sofa, Tars and other protocols access.

Connecting the application client to ShenYu gateway is realized through the registration center, which involves the registration of the client and the synchronization of the server data. The registry supports HTTP, ZooKeeper, Etcd, Consul, and Nacos.

Refer to the client access configuration in the user documentation for Application Client Config.

3.3.1 Design principle

Client

![Diagram showing the design principle of Application Client Access]

Declare the registry client type, such as HTTP or ZooKeeper, in your microservice configuration. Use SPI to load and initialize the corresponding registry client when the application starts, implement the post-processor interface associated with the Spring Bean, get the service interface information to register in it, and place the obtained information into Disruptor.

The Registry client reads data from the Disruptor and registers the interface information with shenyu-admin, where the Disruptor decouples data from operations for scaling.
Declare the registry server type, such as HTTP or ZooKeeper, in the Shenyu-Admin configuration. When shenyu-admin is started, it will read the configuration type, load and initialize the corresponding registry server, and when the registry server receives the interface information registered by shenyu-client, it will put it into Disruptor, which will trigger the registration processing logic to update the interface information and publish a synchronous event.

Disruptor provides data and operations decoupling for expansion. If there are too many registration requests, resulting in abnormal registration, there is also a data buffer role.

### 3.3.2 Http Registry

The principle of HTTP service registration is relatively simple. After Shenyu-Client is started, the relevant service registration interface of Shenyu-Admin will be called to upload data for registration.

After receiving the request, shenyu-admin will update the data and publish the data synchronization event to synchronize the interface information to ShenYu Gateway.

### 3.3.3 Zookeeper Registry

Zookeeper storage struct is:

```plaintext
shenyu
  ├── register
  │   ├── metadata
  │   │   └── ${rpcType}
  │   │       └── ${contextPath}
  │   │               └── ${ruleName} : save metadata data of MetaDataRegisterDTO
  │   ├── uri
  │   │   └── ${rpcType}
  │   │       └── ${contextPath}
  │   │               └── ${ip:prot} : save uri data of URIRegisterDTO
  │   │                   └── ${ip:prot}
```

Shenyu-client starts up, the service interface information (MetaDataRegisterDTO/URIRegisterDTO) wrote above the Zookeeper nodes.

Shenyu-admin uses the Watch mechanism of Zookeeper to monitor events such as data update and deletion, and triggers the corresponding registration processing logic after data changes. Upon receipt of a change to the MetadataRegisterDTO node, the data change and data synchronization event publication of the selector and rule is triggered. Upon receipt of a UriRegisterDTO node change, the upstream of the selector is triggered to publish an update and data synchronization event.
3.3.4 Etcd Registry

Etcd storage struct is:

```
├─_regsiter
│   └─_metadata
│       └─${rpcType}
│           └─${contextPath}
│                   └─${ruleName} : save metadata data ofMetaDataRegisterDTO
├─_uri
│   └─${rpcType}
│       └─${contextPath}
│               └─${ip:prot} : save uri data ofURIRegisterDTO
```

shenyu-client starts up, the service interface information (MetaDataRegisterDTO/URIRegisterDTO) wrote in Ephemeral way above Etcd of the node.

shenyu-admin uses Etcd’s Watch mechanism to monitor events such as data update and deletion, and triggers the corresponding registration processing logic after data changes. Upon receipt of a change to the MetadataRegisterDTO node, the data change and data synchronization event publication of the selector and rule is triggered. Upon receipt of a UriRegisterDTO node change, the upstream of the selector is triggered to publish an update and data synchronization event.

3.3.5 Consul Registry

Consul register client will save URIRegisterDTO to service instance metadata, and URIRegisterDTO will disappear with service unregister.

And Consul register client will save MetaDataRegisterDTO to Key/Value store, storage struct is:

```
├─_regsiter
│   └─_metadata
│       └─${rpcType}
```
When shenyu-client is started, the service interface information (MetaDataRegisterDTO/URIRegisterDTO) on the Metadata of the ServiceInstance (URIRegisterDTO) and Key-Value (MetaDataRegisterDTO), Store as described above.

shenyu-admin senses the update and deletion of data by monitoring the change of index of Catalog and KeyValue, and triggers the corresponding registration processing logic after the change of data. Upon receipt of a change to the MetadataregisterDTO node, the data change and data synchronization event publication of the selector and rule is triggered. Upon receipt of a UriRegisterDTO node change, the upstream of the selector is triggered to publish an update and data synchronization event.

### 3.3.6 Nacos Register

Nacos registration is divided into two parts: URI and Metadata. URI is registered by instance. In case of service exception, the relevant URI data node will be deleted automatically and send events to the subscriber, and the subscriber will carry out relevant offline processing. Metadata is registered by configuration without any related up-down operation. When a URI instance is registered, the Metadata configuration will be published accordingly. The subscriber monitors data changes and carries out update processing.

The URI instance registration command rules are as follows:

```bash
shenyu.register.service.${rpcType}
```

Listens on all RpcType nodes initially, and the ${contextPath} instances registered under them are distinguished by IP and Port, and carry their corresponding contextPath information. After the URI instance is offline, it triggers the update and data synchronization event publication of the selector’s upstream.

When the URI instance goes online, the corresponding Metadata data will be published. The node name command rules are as follows:

```bash
shenyu.register.service.${rpcType}.${contextPath}
```

The subscriber side continues to listen for all Metadata configurations, triggering selector and rule data changes and data synchronization events after the initial subscription and configuration update.

3.4 Flow Control

ShenYu gateway realizes flow control through plugins, selectors and rules. For related data structure, please refer to the previous ShenYu Admin Database Design.

3.4.1 Plugin

In ShenYu Admin System, each plugin uses Handle (JSON format) fields to represent different processing, and the plugin processing is used to manage and edit the custom processing fields in the JSON.

The main purpose of this feature is to enable plugins to handle templated configurations.
3.4.2 Selector And Rule

Selector and rule are the most soul of ShenYu Gateway. Master it and you can manage any traffic.

A plugin has multiple selectors, and one selector corresponds to multiple rules. The selector is the first level filter of traffic, and the rule is the final filter. For a plugin, we want to meet the traffic criteria based on our configuration before the plugin will be executed. Selectors and rules are designed to allow traffic to perform what we want under certain conditions. The rules need to be understood first.

The execution logic of plugin, selector and rule is as follows. When the traffic enters into ShenYu gateway, it will first judge whether there is a corresponding plugin and whether the plugin is turned on. Then determine whether the traffic matches the selector of the plugin. It then determines whether the traffic matches the rules of the selector. If the request traffic meets the matching criteria, the plugin will be executed. Otherwise, the plugin will not be executed. Process the next one. ShenYu gateway is so through layers of screening to complete the flow control.
4.1 Local Deployment

This article introduces how to start the Apache ShenYu gateway in the local environment.

4.1.1 Environmental preparation

- Install JDK1.8+ locally
- Install Git locally
- Install Maven locally
- Choose a development tool, such as IDEA

4.1.2 Download the compiled code

- Download

  ```bash
  > git clone https://github.com/apache/incubator-shenyu.git
  > cd shenyu
  > mvn clean install -Dmaven.javadoc.skip=true -B -Drat.skip=true -Djacoco.skip=true -DskipITs -DskipTests
  ```

- use the development tool to start `org.apache.shenyu.admin.ShenyuAdminBootstrap`, Visit [http://localhost:9095](http://localhost:9095), the default username and password are: admin and 123456 respectively.
  - If you use h2 to store, set the variable `--spring.profiles.active = h2`.
  - If you use MySQL for storage, modify the mysql configuration in `application.yaml`.
- use the development tool to start `org.apache.shenyu.bootstrap.ShenyuBootstrapApplication`. 
4.2 Source Code Deployment

This article introduces the deployment of the Apache ShenYu gateway using the source code.

4.2.1 Start Apache ShenYu Admin

- download 2.4.0 download apache-shenyu-admin-bin-2.4.0-RELEASE.tar.gz
- unzip apache-shenyu-admin-bin-2.4.0-RELEASE.tar.gz, go to the bin directory.
  - use h2 to store data:
    - windows: start.bat --spring.profiles.active = h2
    - linux: ./start.sh --spring.profiles.active = h2
  - use MySQL to store data, go to the /conf directory, and modify the configuration of mysql in application.yaml.
    - windows: start.bat
    - linux: ./start.sh

4.2.2 Start Apache ShenYu Bootstrap

- download 2.4.0 download apache-shenyu-bootstrap-bin-2.4.0-RELEASE.tar.gz
- unzip apache-shenyu-bootstrap-bin-2.4.0-RELEASE.tar.gz, go to the bin directory.
  - windows: start.bat
  - linux: ./start.sh

4.3 Docker Deployment

This article introduces the use of docker to deploy the Apache ShenYu gateway.
### 4.3.1 Start Apache ShenYu Admin

```
> docker pull apache/shenyu-admin  
> docker network create shenyu
```

- use h2 to store data:
  
  ```
  > docker run -d -p 9095:9095 --net shenyu apache/shenyu-admin
  ```

- use MySQL to store data, copy mysql-connector.jar to /$(your_work_dir)/ext-lib:

  ```
  docker run -v /${your_work_dir}/ext-lib:/opt/shenyu-admin/ext-lib -e "SPRING_PROFILES_ACTIVE=mysql" -e "spring.datasource.url=jdbc:mysql://${your_ip_port}/shenyu?useUnicode=true&characterEncoding=utf-8&useSSL=false" -e "spring.datasource.user=${your_username}" -e "spring.datasource.password=${your_password}" -d -p 9095:9095 --net shenyu apache/shenyu-admin
  ```

Another way is to put the application.yml configuration in /$(your_work_dir)/conf, and then execute the following statement:

```
docker run -v $(your_work_dir)/conf:/opt/shenyu-admin/conf/ -v /${your_work_dir}/ext-lib:/opt/shenyu-admin/ext-lib -d -p 9095:9095 --net shenyu apache/shenyu-admin
```

### 4.3.2 Start Apache ShenYu Bootstrap

```
> docker network create shenyu  
> docker pull apache/shenyu-bootstrap  
> docker run -d -p 9195:9195 --net shenyu apache/shenyu-bootstrap
```

### 4.4 k8s Deployment

This article introduces the use of k8s to deploy the Apache ShenYu gateway.

### 4.5 Helm Deployment

This article introduces the use of helm to deploy the Apache ShenYu gateway.
4.6 Custom Deployment

This article describes how to build your own gateway based on Apache ShenYu.

4.6.1 Start Apache ShenYu Admin

- docker reference docker deployment Apache ShenYu Admin
- liunx/windows reference source code deployment Apache ShenYu Admin

4.6.2 Build your own gateway (recommended)

- first create an empty springboot project, you can refer to shenyu-bootstrap, or you can create it on spring official website.
- introduce the following jar package:

```xml
<dependencies>
  <dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-webflux</artifactId>
    <version>2.2.2.RELEASE</version>
  </dependency>
  <dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-actuator</artifactId>
    <version>2.2.2.RELEASE</version>
  </dependency>
  <dependency>
    <groupId>org.apache.shenyu</groupId>
    <artifactId>shenyu-spring-boot-starter-gateway</artifactId>
    <version>${project.version}</version>
  </dependency>
  <dependency>
    <groupId>org.apache.shenyu</groupId>
    <artifactId>shenyu-spring-boot-starter-sync-data-websocket</artifactId>
    <version>${project.version}</version>
  </dependency>
</dependencies>
```

among them, `${project.version}` please use the current latest version.
- add the following configuration to your application.yaml file:

```yaml
spring:
  main:
    allow-bean-definition-overriding: true
management:
```

4.6. Custom Deployment
health:
  defaults:
    enabled: false
shenyu:
  sync:
    websocket:
      urls: ws://localhost:9095/websocket  //set to your shenyu-admin address
5.1 Quick start with Http

This document introduces how to quickly access the ShenYu gateway using Http. You can get the code example of this document by clicking here.

5.1.1 Environment to prepare

Please refer to the deployment to select a way to start shenyu-admin. For example, start the ShenYu gateway management system through local deployment.

After successful startup, you need to open the Divide plugin on in the BasicConfig -> Plugin. In the ShenYu gateway, the HTTP request is handled by the Divide plugin.

If you are a startup gateway by means of source, can be directly run the ShenyuBootstrapApplication of shenyu-bootstrap module.

Note: Before starting, make sure the gateway has added dependencies.

Add the following dependencies to the gateway’s pom.xml file:

```xml
<!--if you use http proxy start this-->  
<dependency>     
  <groupId>org.apache.shenyu</groupId>     
  <artifactId>shenyu-spring-boot-starter-plugin-divide</artifactId>     
  <version>${project.version}</version>  
</dependency>  

<dependency>     
  <groupId>org.apache.shenyu</groupId>     
  <artifactId>shenyu-spring-boot-starter-plugin-httpclient</artifactId>     
  <version>${project.version}</version>  
</dependency>
```
5.1.2 Run the shenyu-examples-http project

Download shenyu-examples-http

Execute the `org.apache.shenyu.examples.http.ShenyuTestHttpApplication` main method to start project.

The following log appears when the startup is successful:

```java
2021-02-10 00:57:07.561 INFO 3700 --- [pool-1-thread-1] o.d.s.client.common.utils.

(JVM running for 3.411)
```

5.1.3 Test

The shenyu-examples-http project will automatically register interface methods annotated with `@ShenyuSpringMvcClient` in the shenyu gateway after successful startup.

Open PluginList -> rpc proxy -> divide to see the list of plugin rule configurations:
Use PostMan to simulate HTTP to request your http service:

```
POST  http://localhost:9195/order/save
```

This document introduces how to quickly access the ShenYu gateway using Dubbo. You can get the code example of this document by clicking here.

### 5.2 Quick start with Dubbo

This document introduces how to quickly access the ShenYu gateway using Dubbo. You can get the code example of this document by clicking here.

#### 5.2.1 Environment to prepare

Please refer to the deployment to select a way to start shenyu-admin. For example, start the ShenYu gateway management system through local deployment.

After successful startup, you need to open the Dubbo plugin on in the BasicConfig -> Plugin, and set your registry address. Please make sure the registry center is open locally.

If you are a startup gateway by means of source, can be directly run the ShenyuBootstrapApplication of shenyu-bootstrap module.

Note: Before starting, make sure the gateway has added dependencies.

If client is apache dubbo, registry center is Zookeeper, please refer to the following configuration:

```xml
<dependency>
  <groupId>org.apache.shenyu</groupId>
  <!-- ... -->
</dependency>
```
<artifactId>shenyu-spring-boot-starter-plugin-alibaba-dubbo</artifactId>
<version>${project.version}</version>
</dependency>

<dependency>
  <groupId>com.alibaba</groupId>
  <artifactId>dubbo</artifactId>
  <version>${alibaba.dubbo.version}</version>
</dependency>

<dependency>
  <groupId>org.apache.curator</groupId>
  <artifactId>curator-framework</artifactId>
  <version>4.0.1</version>
</dependency>

<dependency>
  <groupId>org.apache.curator</groupId>
  <artifactId>curator-recipes</artifactId>
  <version>4.0.1</version>
</dependency>

<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-spring-boot-starter-plugin-alibaba-dubbo</artifactId>
  <version>${project.version}</version>
</dependency>

<dependency>
  <groupId>com.alibaba</groupId>
  <artifactId>dubbo</artifactId>
  <version>${alibaba.dubbo.version}</version>
</dependency>

<dependency>
  <groupId>org.apache.curator</groupId>
  <artifactId>curator-client</artifactId>
  <version>4.0.1</version>
</dependency>

<dependency>
  <groupId>org.apache.curator</groupId>
  <artifactId>curator-framework</artifactId>
  <version>4.0.1</version>
</dependency>

<dependency>
  <groupId>org.apache.curator</groupId>
  <artifactId>curator-recipes</artifactId>
  <version>4.0.1</version>
</dependency>

If client is alibaba dubbo, registry center is Zookeeper, please refer to the following configuration:

<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-spring-boot-starter-plugin-alibaba-dubbo</artifactId>
  <version>${project.version}</version>
</dependency>

<dependency>
  <groupId>com.alibaba</groupId>
  <artifactId>dubbo</artifactId>
  <version>${alibaba.dubbo.version}</version>
</dependency>

<dependency>
  <groupId>org.apache.curator</groupId>
  <artifactId>curator-client</artifactId>
  <version>4.0.1</version>
</dependency>

<dependency>
  <groupId>org.apache.curator</groupId>
  <artifactId>curator-framework</artifactId>
  <version>4.0.1</version>
</dependency>

<dependency>
  <groupId>org.apache.curator</groupId>
  <artifactId>curator-recipes</artifactId>
  <version>4.0.1</version>
</dependency>

5.2. Quick start with Dubbo
5.2.2 Run the shenyu-examples-dubbo project

Download shenyu-examples-dubbo.

replace the register address in shenyu-examples-alibaba-dubbo-service/src/main/resources/spring-dubbo.xml with your local zk address, such as:

```xml
<dubbo:registry address="zookeeper://localhost:2181"/>
```

Execute the org.apache.shenyu.examples.alibaba.dubbo.service.TestAlibabaDubboApplication main method to start dubbo project.

The following log appears when the startup is successful:

```
RegisterUtils : dubbo client register success: {
  "appName": "dubbo",
  "contextPath": "/dubbo",
  "path": "/dubbo/insert",
  "pathDesc": "Insert a row of data",
  "rpcType": "dubbo",
  "serviceName": "org.dromara.shenyu.examples.dubbo.api.service.DubboTestService",
  "methodName": "insert",
  "ruleName": "/dubbo/insert",
  "parameterTypes": "org.dromara.shenyu.examples.dubbo.api.entity.DubboTest",
  "rpcExt": "{\"group\":\"\",\"version\":\"\",\"loadbalance\":\"random\",\"retries\":2,\"timeout\":10000,\"url\":\"\"},
  "enabled":true}
```

```
RegisterUtils : dubbo client register success: {
  "appName": "dubbo",
  "contextPath": "/dubbo",
  "path": "/dubbo/findAll",
  "pathDesc": "Get all data",
  "rpcType": "dubbo",
  "serviceName": "org.dromara.shenyu.examples.dubbo.api.service.DubboTestService",
  "methodName": "findAll",
  "ruleName": "/dubbo/findAll",
  "parameterTypes": "",
  "rpcExt": "{\"group\":\"\",\"version\":\"\",\"loadbalance\":\"random\",\"retries\":2,\"timeout\":10000,\"url\":\"\"},
  "enabled":true}
```

5.2. Quick start with Dubbo
5.2. Quickstart with Dubbo
### 5.2.3 Test

The *shenyu-examples-dubbo* project will automatically register interface methods annotated with `@ShenyuDubboClient` in the ShenYu gateway after successful startup.

Open PluginList -> rpc proxy -> dubbo to see the list of plugin rule configurations:

Use PostMan to simulate HTTP to request your Dubbo service:

```json
GET http://localhost:9105/dubbo/findByStringArray
```

---

5.2. Quick start with Dubbo
Complex multi-parameter example: The related interface implementation class is `org.apache.shenyu.examples.alibaba.dubbo.service.impl.DubboMultiParamServiceImpl#batchSaveAndNameAndId`.

```java
@ShenyuDubboClient(path = "/batchSaveAndNameAndId")
public DubboTest batchSaveAndNameAndId(List<DubboTest> dubboTestList, String id, String name) {
    DubboTest test = new DubboTest();
    test.setId(id);
    test.setName("hello world shenyu alibaba dubbo param batchSaveAndNameAndId :
    name + ":" + dubboTestList.stream().map(DubboTest::getName).collect(Collectors.
        joining("-")));    
    return test;
}
```

When your arguments do not match, the following exception will occur:

```

```

5.2. Quick start with Dubbo
5.3 Quick start with Spring Cloud

This document introduces how to quickly access the ShenYu gateway using Spring Cloud. You can get the code example of this document by clicking here.

5.3.1 Environment to prepare

Please refer to the deployment to select a way to start shenyu-admin. For example, start the ShenYu gateway management system through local deployment.

After successful startup, you need to open the springCloud plugin on in the BasicConfig -> Plugin.

If you are a startup gateway by means of source, can be directly run the ShenyuBootstrapApplication of shenyu-bootstrap module.

Note: Before starting, make sure the gateway has added dependencies.

Add the gateway proxy plugin for Spring Cloud and add the your registry center dependencies:

```
<!--shenyu springCloud plugin start-->
<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-spring-boot-starter-plugin-springcloud</artifactId>
  <version>${project.version}</version>
</dependency>
<dependency>
  <groupId>org.springframework.cloud</groupId>
  <artifactId>spring-cloud-commons</artifactId>
</dependency>
<!--shenyu springCloud plugin end-->
```
<dependency>
  <groupId>org.springframework.cloud</groupId>
  <artifactId>spring-cloud-starter-netflix-ribbon</artifactId>
  <version>2.2.0.RELEASE</version>
</dependency>

<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-spring-boot-starter-plugin-httpclient</artifactId>
  <version>${project.version}</version>
</dependency>

<dependency>
  <groupId>org.springframework.cloud</groupId>
  <artifactId>spring-cloud-starter-netflix-eureka-client</artifactId>
  <version>2.2.0.RELEASE</version>
</dependency>

<dependency>
  <groupId>org.springframework.cloud</groupId>
  <artifactId>spring-cloud-starter-netflix-eureka-client</artifactId>
  <version>2.2.0.RELEASE</version>
</dependency>

<!-- springCloud if you config register center is eureka please dependency end-->

eureka config information:

eureka:
  client:
    serviceUrl:
      defaultZone: http://localhost:8761/eureka/
    instance:
      prefer-ip-address: true

Restart the shenyu-bootstrap project.

5.3.2 Run the shenyu-examples-springcloud project

In the example project we used Eureka as the registry for Spring Cloud. You can use the local Eureka or the application provided in the example.

Download shenyu-examples-eureka、shenyu-examples-springcloud.

Startup the Eureka service: Execute the org.apache.shenyu.examples.eureka.EurekaServerApplication main method to start project.

Startup the Spring Cloud service: Execute the org.apache.shenyu.examples.springcloud.ShenyuTestSpringCloudApplication main method to start project.

The following log appears when the startup is successful:
5.3. Quick start with Spring Cloud
DiscoveryClient : Disable delta property : false
DiscoveryClient : Single vip registry refresh property : null
DiscoveryClient : Force full registry fetch : false
DiscoveryClient : Application is null : false
DiscoveryClient : Registered Applications size is zero : true

5.3. Quick start with Spring Cloud
5.3.3 Test

The shenyu-examples-springcloud project will automatically register interface methods annotated with @ShenyuSpringCloudClient in the shenyu gateway after successful startup.

Open PluginList -> rpc proxy -> springCloud to see the list of plugin rule configurations:

Use PostMan to simulate HTTP to request your SpringCloud service:

```
GET /http://localhost:9199/springcloud/order/findById?id=123
```

5.4 Quick start with Sofa

This document introduces how to quickly access the ShenYu gateway using Sofa RPC. You can get the code example of this document by clicking here.

5.4.1 Environment to prepare

Please refer to the deployment to select a way to start shenyu-admin. For example, start the ShenYu gateway management system through local deployment.

After successful startup, you need to open the Sofa plugin on in the BasicConfig -> Plugin, and set your registry address. Please make sure the registry center is open locally.

If you are a startup gateway by means of source, can be directly run the ShenyuBootstrapApplication of shenyu-bootstrap module.

Note: Before starting, make sure the gateway has added dependencies.

If client is sofa, registry center is Zookeeper, please refer to the following configuration:
5.4.2 Run the shenyu-examples-sofa project

Download shenyu-examples-sofa, replace the register address in spring-dubbo.xml with your local zk address, such as:

```xml
<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-spring-boot-starter-plugin-sofa</artifactId>
  <version>${project.version}</version>
</dependency>
```

Execute the org.apache.shenyu.examples.sofa.service.TestSofaApplication main method to start sofa service.

The following log appears when the startup is successful:

```
2021-02-10 02:31:45.599 INFO 2156 --- [pool-1-thread-1] o.d.s.client.common.utils.

5.4.3 Test

The shenyu-examples-sofa project will automatically register interface methods annotated with @ShenyuSofaClient in the shenyu gateway after successful startup.

Open PluginList -> rpc proxy -> sofa to see the list of plugin rule configurations:

Use PostMan to simulate HTTP to request your Sofa service:

Complex multi-parameter example: The related interface implementation class is org.apache.shenyu.examples.sofa.service.impl.SofaMultiParamServiceImpl#batchSaveNameAndId

5.4. Quick start with Sofa
```
@override
@ShenyuSofaClient(path = "/batchSaveNameAndId"
public SofaSimpleTypeBean batchSaveNameAndId(final List<SofaSimpleTypeBean> sofaTestList, final String id, final String name) {
    SofaSimpleTypeBean simpleTypeBean = new SofaSimpleTypeBean();
    simpleTypeBean.setId(id);
    simpleTypeBean.setName("hello world shenyu sofa param batchSaveAndNameAndId : "+ name + ":" + sofaTestList.stream().map(SofaSimpleTypeBean::getName).collect(Collectors.joining("-")));
    return simpleTypeBean;
}
```

5.5 Quick start with gRPC

This document introduces how to quickly access the ShenYu gateway using gRPC. You can get the code example of this document by clicking [here](#).

5.5.1 Prepare For Environment

Please refer to the deployment to select a way to start shenyu-admin. For example, start the ShenYu gateway management system through local deployment.

After successful startup, you need to open the gRPC plugin on in the BasicConfig -> Plugin.

If you are a startup gateway by means of source, can be directly run the ShenyuBootstrapApplication of shenyu-bootstrap module.

Note: Before starting, make sure the gateway has added dependencies.

Add the following dependencies to the gateway’s pom.xml file:
5.5.2 Run the shenyu-examples-grpc project

Download shenyu-examples-grpc

Run the following command under shenyu-examples-grpc to generate Java code:

mvn protobuf:compile
mvn protobuf:compile-custom

Execute the org.apache.shenyu.examples.grpc.ShenyuTestGrpcApplication main method to start project.

The following log appears when the startup is successful:

    "appName": "127.0.0.1:8880",
    "contextPath": "/grpc",
    "path": "/grpc/clientStreamingFun",
    "pathDesc": "clientStreamingFun",
    "rpcType": "grpc",
    "serviceName": "stream.StreamService",
    "methodName": "clientStreamingFun",
    "ruleName": "/grpc/clientStreamingFun",
    "parameterTypes": 
        "io.grpc.stub.StreamObserver",
    "rpcExt": 
        "{"timeout":5000, "methodType":"CLIENT_STREAMING"}",
    "enabled": true,
    "host": "172.20.10.6",
    "port": 8080,
    "registerMetaData": false}

    "appName": "127.0.0.1:8880",
    "contextPath": "/grpc",
    "path": "/grpc/echo",
    "pathDesc": "echo",
    "rpcType": "grpc",
    "serviceName": "echo.EchoService",
    "methodName": "echo",
    "ruleName": "/grpc/echo",
    "parameterTypes": "io.grpc.stub.StreamObserver",
    "rpcExt": 
        "{"timeout":5000, "methodType":"UNARY"}",
    "enabled": true,
    "host": "172.20.10.6",
    "port": 8080,
    "registerMetaData": false}

    "appName": "127.0.0.1:8880",
    "contextPath": "/grpc",
    "path": "/grpc/bidiStreamingFun",
    "pathDesc": "bidiStreamingFun",
    "rpcType": "grpc",
    "serviceName": "stream.StreamService",
    "methodName": "bidiStreamingFun",
    "ruleName": "/grpc/bidiStreamingFun",
    "parameterTypes": "io.grpc.stub.StreamObserver",
    "rpcExt": 
        "{"timeout":5000, "methodType":"BIDI_STREAMING"}",
    "enabled": true,
    "host": "172.20.10.6",
    "port": 8080,
    "registerMetaData": false}

    "appName": "127.0.0.1:8880",
    "contextPath": "/grpc",
    "path": "/grpc/unaryFun",
    "pathDesc": "unaryFun",
    "rpcType": "grpc",
    "serviceName": "stream.StreamService",
    "methodName": "unaryFun",
    "ruleName": "/grpc/unaryFun",
    "parameterTypes": "stream.RequestData,io.grpc.stub.StreamObserver",
    "rpcExt": 
        "{"timeout":5000, "methodType":"UNARY"}",
    "enabled": true,
    "host": "172.20.10.6"}
The `shenyu-examples-grpc` project will automatically register interface methods annotated with `@ShenyuGrpcClient` in the shenyu gateway after successful startup.

Open PluginList -> rpc proxy -> gRPC to see the list of plugin rule configurations:

Use postman to simulate http to request your gRPC service. The following is the request body.

```json
{
    "data": [
        {
            "message": "hello grpc"
        }
    ]
}
```
The parameters are passed in json format. The name of the key is data by default, and you can reset it in GrpcConstants.JSON_DESCRIPTOR_PROTO_FIELD_NAME. The input of value is based on the proto file defined by you.

### 5.5.4 Streaming

The shenyu can support streaming of gRPC. The following shows the calls of the four method types of gRPC. In streaming, you can pass multiple parameters in the form of an array.

- **UNARY**

  The request body like this.

  ```json
  {
    "data": [
      {
        "text": "hello grpc"
      }
    ]
  }
  ```

  Then, call gRPC service by UNARY method type.

5.5. Quick start with gRPC
There is a request body like this.

```
{
"data": [
{
"text": "hello grpc"
},
{
"text": "hello grpc"
},
{
"text": "hello grpc"
}
]
}
```

Then, call gRPC service by CLIENT_STREAMING method type.

- CLIENT_STREAMING

The request body like this.

```
{
"data": [
{
"text": "hello grpc"
},
{
"text": "hello grpc"
},
{
"text": "hello grpc"
}
]
}
```
The request body like this.

```json
{
  "data": [
    {
      "text": "hello grpc"
    }
  ]
}
```

Then, call gRPC service by SERVER_STREAMING method type.
The request body like this.

```json
{
  "data": [
    {
      "text": "hello grpc"
    },
    {
      "text": "hello grpc"
    },
    {
      "text": "hello grpc"
    }
  ]
}
```

Then, call gRPC service by BIDI_STREAMING method type.
5.6 Quick start with Tars

This document introduces how to quickly access the ShenYu Gateway using Tars. You can get the code example of this document by clicking here.

5.6.1 Environment to prepare

Please refer to the deployment to select a way to start shenyu-admin. For example, start the ShenYu gateway management system through local deployment.

After successful startup, you need to open the Sofa plugin on in the BasicConfig -> Plugin.

If you are a startup gateway by means of source, can be directly run the ShenyuBootstrapApplication of shenyu-bootstrap module.

Note: Before starting, make sure the gateway has added dependencies.

`shenyu-bootstrap` need to import tars dependencies:

```xml
<dependency>
    <groupId>org.apache.shenyu</groupId>
    <artifactId>shenyu-spring-boot-starter-plugin-tars</artifactId>
    <version>${project.version}</version>
</dependency>

<dependency>
    <groupId>com.tencent.tars</groupId>
</dependency>
```
5.6.2 Run the shenyu-examples-tars project

Download shenyu-examples-tars.

Modify host in application.yml to be your local IP

Modify config src/main/resources/ShenyuExampleServer.ShenyuExampleApp.config.conf:

- It is recommended to make clear the meaning of the main configuration items of config, refer to the development guide
- bind IP in config should pay attention to providing cost machine
- local=⋯, Indicates the open port that the native machine connects to the tarsnode. If there is no tarsnode, this configuration can be dropped
- locator: Indicates the address (frame address) of the main control center, which is used to obtain the IP list according to the service name, If Registry is not required to locate the service, this configuration can be dropped
- node=tars.tarsnode.Server0bj@xxxx, Indicates the address of the connected tarsnode. If there is no tarsnode locally, this configuration can be removed

More config configuration instructions, Please refer to TARS Official Documentation

Execute the org.apache.shenyu.examples.tars.ShenyuTestTarsApplication main method to start project.

**Note:** The configuration file address needs to be specified in the startup command when the service starts `-Dconfig=xxx/ShenyuExampleServer.ShenyuExampleApp.config.conf`

If the -Dconfig parameter is not added, the configuration may throw the following exceptions:

```java
com.qq.tars.server.config.ConfigurationException: error occurred on load server config
    at com.qq.tars.server.config ConfigurationManager.

[SERVER] server is ready...
TomcatWebServer : Tomcat started on port(s): 55290 (http) with context path ''
ShenyuTestTarsApplication : Started ShenyuTestTarsApplication in 4.232 seconds (JVM running for 5.1)
utils.RegisterUtils : tars client register success: {{"appName":"127.0.0.1:21715", "contextPath":"/tars","path":"/tars/helloInt","pathDesc":"","rpcType":"tars", "serviceName":"ShenyuExampleServer.ShenyuExampleApp.HelloObj","methodName":"helloInt","ruleName":"/tars/helloInt","parameterTypes":"int,java.lang.String", "rpcExt":{"methodInfo":[],"returnType":"java.lang.Integer"},{"methodName":"hello","params":[]},"returnType":"java.lang.String"},"enabled":true}
5.6.3 Test

The shenyu-examples-tars project will automatically register interface methods annotated with @ShenyuTarsClient in the shenyu gateway after successful startup.

Open PluginList -> rpc proxy -> tars to see the list of plugin rule configurations:

Use PostMan to simulate HTTP to request your tars service:

```
<table>
<thead>
<tr>
<th>code</th>
<th>200</th>
</tr>
</thead>
</table>
| message | { "code": 200,  
| data | { "code": 200,  
| time | 2021-02-09 13:28:24.837   
```
5.7 Quick start with Motan

This document introduces how to quickly access the ShenYu gateway using Motan RPC. You can get the code example of this document by clicking here.

5.7.1 Environment to prepare

Please refer to the deployment to select a way to start shenyu-admin. For example, start the ShenYu gateway management system through local deployment.

After successful startup, you need to open the Sofa plugin on in the BasicConfig -> Plugin.

If you are a startup gateway by means of source, can be directly run the ShenyuBootstrapApplication of shenyu-bootstrap module.

Note: Before starting, make sure the gateway has added dependencies.

Start up zookeeper in local.

Import the gateway proxy plugin for Motan and add the following dependencies to the gateway’s pom.xml file:

```xml
<dependency>
    <groupId>org.apache.shenyu</groupId>
    <artifactId>shenyu-spring-boot-starter-plugin-motan</artifactId>
    <version>${project.version}</version>
</dependency>
<dependency>
    <groupId>com.weibo</groupId>
    <artifactId>motan-core</artifactId>
    <version>1.1.9</version>
</dependency>
<dependency>
    <groupId>com.weibo</groupId>
    <artifactId>motan-registry-zookeeper</artifactId>
    <version>1.1.9</version>
</dependency>
<dependency>
    <groupId>com.weibo</groupId>
    <artifactId>motan-transport-netty4</artifactId>
    <version>1.1.9</version>
</dependency>
```
5.7.2 Run the shenyu-examples-motan project

Download shenyu-examples-motan.

Run main method of org.apache.shenyu.examples.motan.service.TestMotanApplication to start this project.

log info as follows after starting:

```
2021-07-18 16:46:25.388 INFO 96 --- [main] o.s.b.w.embedded.tomcat.TomcatWebServer : Tomcat started on port(s): 8081 (http) with context path ''
2021-07-18 16:46:25.393 INFO 96 --- [main] o.a.s.e.m.service.TestMotanApplication : Started TestMotanApplication in 3.89 seconds (JVM running for 4.514)
2021-07-18 16:46:25.399 INFO 96 --- [Thread-6] o.a.s.c.c.s.ShenyuClientShutdownHook : hook Thread-0 will sleep 3000ms when it start
2021-07-18 16:46:25.399 INFO 96 --- [Thread-6] o.a.s.c.c.s.ShenyuClientShutdownHook : hook SpringContextShutdownHook will sleep 3000ms when it start
  "appName":"motan","contextPath":"/motan","path":"/motan/hello","pathDesc":"","rpcType":"motan","serviceName":"org.apache.shenyu.examples.motan.service.MotanDemoService","methodName":"hello","ruleName":"/motan/hello","parameterTypes":"java.lang.String","rpcExt":{
  "MethodInfo":{
    "methodName":"hello","params":{
      "left":"java.lang.String","right":"name"}
  }
},"group":"motan-shenyu-rpc"},"enabled":true,"host":"192.168.220.1","port":8081,"registerMetaData":false}
```
5.7.3 Test

The shenyu-examples-motan project will automatically register the @ShenyuMotanClient annotated interface methods with the gateway and add selectors and rules. If not, you can manually add them.

Open PluginList -> rpc proxy -> motan to see the list of plugin rule configurations:

Use PostMan to simulate HTTP to request your Motan service:
6.1 Integrate Http with shenyu gateway

6.1.1 Features

- This chapter is a guide about integrating Http service with ShenYu Gateway.
- ShenYu Gateway uses divide plugin handling http request, pls enable it in shenyu-admin back-ground.
- Please start shenyu-admin successfully before integrating and Environment Setup is Ok.

6.1.2 Configure ShenYu Gateway as Http proxy.

- Add these dependencies in gateway’s pom.xml:

```xml
<dependency>
    <groupId>org.apache.shenyu</groupId>
    <artifactId>shenyu-spring-boot-starter-plugin-divide</artifactId>
    <version>${last.version}</version>
</dependency>
<dependency>
    <groupId>org.apache.shenyu</groupId>
    <artifactId>shenyu-spring-boot-starter-plugin-httpclient</artifactId>
    <version>${last.version}</version>
</dependency>
```

- pls restart the gateway.
6.1.3 HTTP request via ShenYu Gateway (springMVC user)

- pls make sure divide plugin has enabled in shenyu-admin background.

add Shenyu-Client methods (available for SpringMVC, SpringBoot user)

- SpringBoot User
  - Add these dependencies in your local maven repository pom.xml:
    ```xml
    <dependency>
      <groupId>org.apache.shenyu</groupId>
      <artifactId>shenyu-spring-boot-starter-client-springmvc</artifactId>
      <version>${last.version}</version>
    </dependency>
    ```
  - Backend server register center config, please look: register center access.

- SpringMVC User
  - Add these dependencies in your local maven repository pom.xml:
    ```xml
    <dependency>
      <groupId>org.apache.shenyu</groupId>
      <artifactId>shenyu-client-springmvc</artifactId>
      <version>${last.version}</version>
    </dependency>
    ```
  - Inject these properties into your Spring beans XML file:
    ```xml
    <bean id="springMvcClientBeanPostProcessor" class="org.apache.shenyu.client.springmvc.init.SpringMvcClientBeanPostProcessor">
      <constructor-arg ref="shenyuRegisterCenterConfig"/>
    </bean>
    <bean id="shenyuRegisterCenterConfig" class="org.apache.shenyu.register.common.config.ShenyuRegisterCenterConfig;">
      <property name="registerType" value="http"/>
      <property name="serverList" value="http://localhost:9095"/>
      <property name="props">
        <map>
          <entry key="contextPath" value="/your contextPath"/>
          <entry key="appName" value="your server name"/>
          <entry key="port" value="your server port"/>
          <entry key="isFull" value="false"/>
        </map>
      </property>
    </bean>
    ```
  - Add this annotation @ShenyuSpringMvcClient in your controller interface.

6.1. Integrate HTTP with shenyu gateway
You can apply the annotation to class-level in a controller. The name of the path variable is prefix and ‘/**’ will apply proxy for entire interfaces.

- Example1: both /test/payment and /test/findByUserId will be handled by proxy service.

```java
@RestController
@RequestMapping("/test")
@ShenyuSpringMvcClient(path = "/test/**")
public class HttpTestController {

    @PostMapping("/payment")
    @ShenyuSpringMvcClient(path = "/save")
    public UserDTO post(@RequestBody final UserDTO userDTO) {
        return userDTO;
    }

    @GetMapping("/findByUserId")
    public UserDTO findByUserId(@RequestParam("userId") final String userId) {
        UserDTO userDTO = new UserDTO();
        userDTO.setUserId(userId);
        userDTO.setUserName("hello world");
        return userDTO;
    }
}
```

- Example2: /order/save will be handled by proxy service, but /order/findBy.Id won’t.

```java
@RestController
@RequestMapping("/order")
@ShenyuSpringMvcClient(path = "/order")
public class OrderController {

    @PostMapping("/save")
    @ShenyuSpringMvcClient(path = "/save")
    public OrderDTO save(@RequestBody final OrderDTO orderDTO) {
        orderDTO.setName("hello world save order");
        return orderDTO;
    }

    @GetMapping("/findBy.Id")
    public OrderDTO findById(@RequestParam("id") final String id) {
        OrderDTO orderDTO = new OrderDTO();
        orderDTO.setUserId(id);
        orderDTO.setUserName("hello world findBy.Id");
        return orderDTO;
    }
}
```

- Kick off your project with your interface, which is integrated with ShenYu Gateway.
6.1.4 Configure ShenYu Gateway as an Http proxy (other framework)

- first of all, enable the divide plugin in shenyu-admin, then add selector and rule which will filter the request.
- if you don’t know how to configure, pls refer to selector guide.
- you can also develop your customized http-client, refer to multi-language Http client development.

6.1.5 User request

- Send the request as before, only two points need to notice.
- Firstly, the domain name that requested before in your service, now need to replace with gateway’s domain name.
- Secondly, ShenYu Gateway needs a route prefix which comes from contextPath, it configured during the integration with gateway, you can change it freely in divide plugin of shenyu-admin, if you are familiar with it.
  - for example, if you have an order service and it has an interface, the request url: http://localhost:8080/test/save
  - Now need to change to: http://localhost:9195/order/test/save
  - We can see localhost:9195 is your gateway’s ip port, default port number is 9195, /order is your contextPath which you configured with gateway.
  - other parameters doesn’t change in request method.
  - Any questions, pls join the group and we can talk about it.
- Then you can visit, very easy and simple.

6.2 Integrate dubbo with ShenYu Gateway

6.2.1 Features

- This chapter is a guide about integrating dubbo service with ShenYu Gateway.
- Support Alibaba Dubbo(<2.7.x) and Apache Dubbo (>=2.7.x).
- Please start shenyu-admin successfully before integrating, and Environment Setup is Ok.
6.2.2 Configure shenyu gateway as Dubbo proxy

- Add these dependencies in gateway’s pom.xml.
- Alibaba dubbo user, configure the dubbo version and registry center with yours.

```xml
<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-spring-boot-starter-plugin-alibaba-dubbo</artifactId>
  <version>${last.version}</version>
</dependency>
```

- Apache dubbo user, configure the dubbo version and registry center with yours.

```xml
<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-spring-boot-starter-plugin-apache-dubbo</artifactId>
  <version>${last.version}</version>
</dependency>
```
restart gateway service.

Dubbo integration with gateway, pls refer to: shenyu-examples-dubbo

Alibaba Dubbo User

- SpringBoot

  * Add these dependencies:

    <dependency>
      <groupId>org.apache.shenyu</groupId>
      <artifactId>shenyu-spring-boot-starter-client-alibaba-dubbo</artifactId>
      <version>${last.version}</version>
    </dependency>

  * backend server register center config, please look: register center access.

- Spring
* Add these dependencies:

```xml
<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-client-alibaba-dubbo</artifactId>
  <version>${last.version}</version>
</dependency>
```

* Inject these properties into your Spring beans XML file:

```xml
<bean id="alibabaDubboServiceBeanPostProcessor" class="org.apache.shenyu.client.alibaba.dubbo.AlibabaDubboServiceBeanPostProcessor">
  <constructor-arg ref="shenyuRegisterCenterConfig"/>
</bean>

<bean id="shenyuRegisterCenterConfig" class="org.apache.shenyu.register.common.config.ShenyuRegisterCenterConfig">
  <property name="registerType" value="http"/>
  <property name="serverList" value="http://localhost:9095"/>
  <property name="props">
    <map>
      <entry key="contextPath" value="/your contextPath"/>
      <entry key="appName" value="your name"/>
      <entry key="isFull" value="false"/>
    </map>
  </property>
</bean>
```

• Apache Dubbo User

  – SpringBoot

   * Add these dependencies:

```xml
<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-spring-boot-starter-client-apache-dubbo</artifactId>
  <version>${last.version}</version>
</dependency>
```

* backend server register center config, please look: register center_access:

  – Spring

   * Add these dependencies:

```xml
<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-client-apache-dubbo</artifactId>
  <version>${last.version}</version>
</dependency>
```
* Inject these properties into your Spring beans XML file:

```xml
<bean id="apacheDubboServiceBeanPostProcessor" class="org.apache.shenyu.client.apache.dubbo.ApacheDubboServiceBeanPostProcessor">
    <constructor-arg ref="shenyuRegisterCenterConfig"/>
</bean>

<bean id="shenyuRegisterCenterConfig" class="org.apache.shenyu.register.common.config.ShenyuRegisterCenterConfig">
    <property name="registerType" value="http"/>
    <property name="serverList" value="http://localhost:9095"/>
    <property name="props">
        <map>
            <entry key="contextPath" value="/your contextPath"/>
            <entry key="appName" value="your name"/>
            <entry key="isFull" value="false"/>
        </map>
    </property>
</bean>
```

### 6.2.3 Dubbo configuration

- Enable dubbo option in shenyu-admin.
- Configure your registry address in dubbo.

```
{"register":"zookeeper://localhost:2181"}  or  
{"register":"nacos://localhost:8848"}
```

**Configure the interface with gateway**

- you can add the annotation @ShenyuDubboClient to your dubbo service implementation class, so that the interface method will be configured with gateway.
- start your provider and get the log dubbo client register success, then your dubbo interface has been added with ShenYu Gateway successfully. Pls refer to shenyu-test-dubbo project.
**Dubbo user request and parameter explanation.**

- communicate with dubbo service through Http transport protocol.
- ShenYu Gateway need a route prefix which configured when accessing the project.

```plaintext
# for example: you have an order service and it has a interface, his registry address: /order/test/save
# now we can communicate with gateway through POST request http://localhost:9195/order/test/save
# localhost:9195 is gateway's ip port, default port is 9195 , /order is the contextPath you set through gateway.
```

- parameter deliver:
  - communicate with gateway through body or json of http post request.
  - more parameter types, pls refer to the interface definition in shenyu-examples-dubbo and parameter passing method.
- Single java bean parameter type (default).
- Multi-parameter type support, add this config value in gateway’s yaml file:

```yaml
shenyu:
dubbo:
  parameter: multi
```

- Support for customized multi-parameter type
- Create a new implementation class A in your gateway project of org.apache.shenyu.web.dubbo.DubboParamResolveService.

```java
public interface DubboParamResolveService {

/**
   * Build parameter pair.
   * this is Resolve http body to get dubbo param.
   *
   * @param body the body
   * @param parameterTypes the parameter types
   * @return the pair
   */
  Pair<String[], Object[]> buildParameter(String body, String parameterTypes);
}
```

- body is the json string in http request.
- parameterTypes: the list of method parameter types that are matched, split with ,.
• in Pair, left is parameter type, right is parameter value, it’s the standard of dubbo generalization calls.

• Inject your class into Spring bean, cover the default implementation.

```java
@Bean
public DubboParamResolveService A() {
    return new A();
}
```

### 6.2.4 Service governance

• Tag route
  - Add Dubbo_Tag_Route when send request, the current request will be routed to the provider of the specified tag, which is only valid for the current request.

• Explicit Target
  - Set the url property in the annotation @ShenyuDubboClient.
  - Update the configuration in Admin.
  - It’s valid for all request.

• Param valid and ShenyuException
  - Set validation="shenyuValidation".
  - When ShenyuException is thrown in the interface, exception information will be returned. It should be noted that ShenyuException is thrown explicitly.

```java
@Service(validation = "shenyuValidation")
public class TestServiceImpl implements TestService {
    @Override
    @ShenyuDubboClient(path = "/test", desc = "test method")
    public String test(@Valid HelloServiceRequest name) throws ShenyuException {
        if (true){
            throw new ShenyuException("Param binding error.");
        }
        return "Hello " + name.getName();
    }
}
```

• Request param

```java
public class HelloServiceRequest implements Serializable {
    private static final long serialVersionUID = -5968745817846710197L;
```

6.2. Integrate dubbo with ShenYu Gateway
```java
@NotEmpty(message = "name cannot be empty")
private String name;

@NotNull(message = "age cannot be null")
private Integer age;

public String getName() {
    return name;
}

public void setName(String name) {
    this.name = name;
}

public Integer getAge() {
    return age;
}

public void setAge(Integer age) {
    this.age = age;
}
```

- Send request

```json
{
    "name": 
}
```

- Response

```json
{
    "code": 500,
    "message": "Internal Server Error",
    "data": "name cannot be empty,age cannot be null"
}
```

- Error message

```json
{
    "code": 500,
    "message": "Internal Server Error",
    "data": "Param binding error."
}
```
Let’s break down this process: http → gateway → dubbo provider

- It basically switches from HTTP request to Dubbo protocol, then invoke Dubbo service and return to the result.
- Two things need to notice after integration with gateway, one is the added annotation @ShenyuDubboClient, another is a path used to specify the request path.
- And you added a config value of contextPath.
- If you still remember, then we can start.
- If you have a function like this, the config value in contextPath is /dubbo

```java
@ShenyuDubboClient(path = "/insert", desc = "insert data")
public DubboTest insert(final DubboTest dubboTest) {
    return dubboTest;
}
```

So our request path is: http://localhost:9195/dubbo/insert, localhost:9195 is the gateway’s domain name, if you changed before, so does with yours here.

How about the request parameter? DubboTest is a java bean object, has 2 parameters, id and name, so we can transfer the value’s json type through request body.

```json
{"id":1234,"name":"XIAO5y"}
```

- If your interface has no parameter, then the value is:

```json
{}
```

- If your interface has multi-parameter, pls refer to the guide above.

### 6.3 SpringCloud Proxy

#### 6.3.1 Features

- This article is a guide about how to integrate Spring Cloud with shenyu gateway quickly.
- Please enable springCloud plugin in shenyu-admin background.
- Please start shenyu-admin successfully before integrating and Environment Setup is Ok.
6.3.2 Configure shenyu gateway as Spring Cloud proxy

• add these dependencies in gateway’s pom.xml:

```xml
<dependency>
    <groupId>org.apache.shenyu</groupId>
    <artifactId>shenyu-spring-boot-starter-plugin-springcloud</artifactId>
    <version>${last.version}</version>
</dependency>

<dependency>
    <groupId>org.springframework.cloud</groupId>
    <artifactId>spring-cloud-commons</artifactId>
    <version>2.2.0.RELEASE</version>
</dependency>

<dependency>
    <groupId>org.springframework.cloud</groupId>
    <artifactId>spring-cloud-starter-netflix-ribbon</artifactId>
    <version>2.2.0.RELEASE</version>
</dependency>
```

• If you use eureka as SpringCloud registry center.
  – add these dependencies:

```xml
<dependency>
    <groupId>org.springframework.cloud</groupId>
    <artifactId>spring-cloud-starter-netflix-eureka-client</artifactId>
    <version>2.2.0.RELEASE</version>
</dependency>
```

• add these config values in gateway’s yaml file:

```
eureka:
  client:
    serviceUrl:
      defaultZone: http://localhost:8761/eureka/  # your eureka address
  instance:
    prefer-ip-address: true
```

• if you use nacos as Spring Cloud registry center.
  – add these dependencies:

```xml
<dependency>
    <groupId>com.alibaba.cloud</groupId>
    <artifactId>spring-cloud-starter-alibaba-nacos-discovery</artifactId>
    <version>2.1.0.RELEASE</version>
</dependency>
```
• add these config values in gateway’s yaml file:

```yaml
spring:
  cloud:
    nacos:
      discovery:
        server-addr: 127.0.0.1:8848 # your nacos address
```

• restart your gateway service.

### 6.3.3 SpringCloud integration with gateway

• add these dependencies in your project:

```xml
<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-spring-boot-starter-client-springcloud</artifactId>
  <version>${last.version}</version>
</dependency>
```

• backend server register center config, please look: register center access.

• add the annotation @ShenyuSpringCloudClient in your controller interface.

• you can apply the annotation to class-level in a controller. the name of the path variable is prefix and ’/**’ will apply proxy for entire interfaces.

  – example (1): both /test/payment and /test/findByUserId will be handled by gateway.

```java
@RestController
@RequestMapping("/test")
@ShenyuSpringCloudClient(path = "/test/**")
public class HttpTestController {

  @PostMapping("/payment")
  public UserDTO post(@RequestBody final UserDTO userDTO) {
    return userDTO;
  }

  @GetMapping("/findByUserId")
  public UserDTO findByUserId(@RequestParam("userId") final String userId) {
    UserDTO userDTO = new UserDTO();
    userDTO.setUserId(userId);
    userDTO.setUserName("hello world");
    return userDTO;
  }
}
```

6.3. SpringCloud Proxy
• example (2): /order/save will be handled by gateway, and /order/findById won’t.

```java
@RestController
@RequestMapping("/order")
@ShenyuSpringCloudClient(path = "/order")
public class OrderController {

  @PostMapping("/save")
  @ShenyuSpringMvcClient(path = "/save")
  public OrderDTO save(@RequestBody final OrderDTO orderDTO) {
    orderDTO.setName("hello world save order");
    return orderDTO;
  }

  @GetMapping("/findById")
  public OrderDTO findById(@RequestParam("id") final String id) {
    OrderDTO orderDTO = new OrderDTO();
    orderDTO.setId(id);
    orderDTO.setName("hello world findById");
    return orderDTO;
  }
}
```

• start your service, get the log dubbo client register success, then your interface has been added with ShenYu gateway successfully.

### 6.3.4 Plugin Setting

• enable Spring Cloud plugin in shenyu-admin.

### 6.3.5 User Request

• Send the request as before, only two points need to notice.

  • firstly, the domain name that requested before in your service, now need to replace with gateway’s domain name.

  • secondly, ShenYu gateway needs a route prefix which comes from contextPath, it configured during the integration with gateway, you can change it freely in divide plugin of shenyu-admin, if you’re familiar with it.

```
# for example, your have an order service and it has a interface, the request url:
http://localhost:8080/test/save

# now need to change to: http://localhost:9195/order/test/save

# we can see localhost:9195 is the gateway's ip port, default port number is 9195 , /order is the contextPath in your config yaml file.
```

6.3. SpringCloud Proxy
# the request of other parameters don't change.

# Any questions, pls join the group and we can talk about it.

- Then you can visit, very easy and simple.

## 6.4 Sofa RPC Proxy

### 6.4.1 Description

- This article is about sofa users using sofa plugin support, and the tutorial of connecting your own sofa service to the shenyu gateway.
- Before connecting, please start shenyu-admin correctly and Setup Environment Ok.

### 6.4.2 Introduce the plugin that the gateway supports for sofa

- Add the following dependencies in the gateway’s pom.xml file:
- Replace the sofa version with yours, and replace the jar package in the registry with yours, The following is a reference.

```xml
<dependency>
    <groupId>com.alipay.sofa</groupId>
    <artifactId>sofa-rpc-all</artifactId>
    <version>5.7.6</version>
</dependency>
<dependency>
    <groupId>org.apache.curator</groupId>
    <artifactId>curator-client</artifactId>
    <version>4.0.1</version>
</dependency>
<dependency>
    <groupId>org.apache.curator</groupId>
    <artifactId>curator-framework</artifactId>
    <version>4.0.1</version>
</dependency>
<dependency>
    <groupId>org.apache.curator</groupId>
    <artifactId>curator-recipes</artifactId>
    <version>4.0.1</version>
</dependency>
<dependency>
    <groupId>org.apache.shenyu</groupId>
    <artifactId>shenyu-spring-boot-starter-plugin-sofa</artifactId>
</dependency>
```
• Restart the gateway service.

6.4.3 sofa service access gateway, you can refer to: shenyu-examples-sofa

• Springboot
  – Introduce the following dependencies:

```xml
<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-spring-boot-starter-client-sofa</artifactId>
  <version>${shenyu.version}</version>
</dependency>
```

  – backend server register center config, please look: register center access.

• Spring
  – Introduce the following dependencies:

```xml
<dependency>
  <groupId>org.apache.shenyu</groupId>
  <artifactId>shenyu-client-sofa</artifactId>
  <version>${project.version}</version>
</dependency>
```

  – Add the following in the xml file of your bean definition:

```xml
<bean id="sofaServiceBeanPostProcessor" class="org.apache.shenyu.client.sofa.SofaServiceBeanPostProcessor">
  <constructor-arg ref="shenyuRegisterCenterConfig"/>
</bean>

<bean id="shenyuRegisterCenterConfig" class="org.apache.shenyu.register.common.config.ShenyuRegisterCenterConfig">
  <property name="registerType" value="http"/>
  <property name="serverList" value="http://localhost:9095"/>
  <property name="props">
    <map>
      <entry key="contextPath" value="/your contextPath"/>
      <entry key="appName" value="your name"/>
      <entry key="isFull" value="false"/>
    </map>
  </property>
</bean>
```
6.4.4 Plugin Settings

- First in the shenyu-admin plugin management, set the sofa plugin to open.
- Secondly, configure your registered address in the sofa plugin, or the address of other registry.

```
{"protocol":"zookeeper","register":"127.0.0.1:2181"}
```

6.4.5 Interface registered to the gateway

- For your sofa service implementation class, add @ShenyuSofaClient annotation to the method, Indicates that the interface method is registered to the gateway.
- Start your provider and output the log sofa client register success. You’re done. Your sofa interface has been published to the shenyu gateway. If you still don’t understand, you can refer to the shenyu-test-sofa project.

6.4.6 sofa user request and parameter description

- To put it bluntly, it is to request your sofa service through http
- Shenyu gateway needs to have a routing prefix, this routing prefix is for you to access the project for configuration contextPath

```
# For example, if you have an order service, it has an interface and its registration path /order/test/save

# Now it's to request the gateway via post: http://localhost:9195/order/test/save

# Where localhost:9195 is the IP port of the gateway, default port is 9195, /order is the contextPath of your sofa access gateway configuration
```

- Parameter passing:
  - Access the gateway through http post, and pass through body and json.
  - For more parameter type transfer, please refer to the interface definition in shenyu-examples-sofa and the parameter transfer method.
- Single java bean parameter type (default)
- Customize multi-parameter support:

```
public interface SofaParamResolveService {

    /**
     * Build parameter pair.
    
```
```java
Pair<String[], Object[]> buildParameter(String body, String parameterTypes);`n
```

- body is the json string passed by body in http.
- parameterTypes: list of matched method parameter types. If there are multiple, use , to separate.
- In Pair, left is the parameter type, and right is the parameter value. This is the standard for sofa generalization calls.
- Register your class as a String bean and override the default implementation.

```java
@Bean
public SofaParamResolveService A() {
    return new A();
}
```
7.1 2.3.0

7.1.1 soul-admin

- Add ‘open’ field to allow app path authentication or not in sign plugin.
- Optimize divide plugin to use common plugin template in soul-dashboard.
- Add default values and rule checks in plugin handler.
- Add resource management to allow user to add plugin, adjust menu and button resource and so on in soul-dashboard and soul-admin.
- Add menu and data permission in soul-admin.
- Add H2 stroe for soul-admin ##### soul-bootstrap
- Add tars plugin
- Add sentinel plugin – Add sofa plugin
- Add Resilience4j plugin for soul-plugin.
- Add Context path mapping plugin for soul-plugin.
- Add Grpc plugin supports grpc protocol.
- Support form submission for dubbo plugin.
- feat(plugin handle):
- Add dist package module
- Add test cases for soul-admin
- Add register center for consul
- Add register center for etcd
- Add register center for nacos
- Add register center for zookeeper
7.2 2.2.0

- Complete plug-in architecture design, plug-in hot-swappable.
- Fully supports all versions of dubbo, alibaba-dubbo, apache-dubbo.
- Support dubbo generalization call, multi-parameter, complex parameter interface.
- Enhance the monitoring plug-in, remove influxdb support, increase memory, CPU, QPS, TPS, response delay and other indicators, and support access to Prometheus.
- The springCloud plug-in supports two registration centers, eureka and nacos.
- Waf plug-in enhancements, black and white albums, and mixed modes.
- Removed the Hystrix fuse function, independent as a plug-in support.
- Modify the data synchronization method bug in Zookeeper, and add the nacos synchronization method.
- Diversified customer support, providing traditional and springboot access to spring.
- Optimize the soul-background control interface.
- Load balancing algorithm bug repair.
- Fix bugs when uploading large files.
8.1 Latest Releases

Apache ShenYu is released as source code tarballs with corresponding binary tarballs for convenience.

Apache ShenYu - Version: 2.3.0 (Release Date: Apr 2, 2020)

• Source Codes: zip tar
• ShenYu-admin Binary Distribution: tar
• ShenYu-bootstrap Binary Distribution: tar

Apache ShenYu Dashboard - Version: 2.3.0 (Release Date: Apr 2, 2020)

• Source Codes: zip tar
• ShenYu-dashboard Binary Distribution: tar

8.2 PDF

Apache ShenYu provides a packaged and downloaded PDF of the blog for users and developers to use.

• English
